01 / DEFINE AND PLAN

Standard operating procedure

Choose a recurring task. Describe the process, then plan one run of it. Keep answers brief and specific.

Process name

When is it used, and what should it produce?

Information used or created

Name every input and output. Reuse these names in the steps. Types: text, number, yes/no, list, or record.

Item name	Type	Meaning	Source*

* At start, or the step number that creates it.

Put systems and workspace access on page 2.

Map one run in DevGraph

Issue = the result to deliver. Tasks = the work that gets it done.

Issue / What result will you deliver this time?

Task 1 / step 1	Task 2 / step 2	Task 3 / step 3
Needs task no. / none	Needs task no. / none	Needs task no. / none
Done when...	**Done when...**	**Done when...**

Use the step names from page 2. Only add real dependencies.

Review / What evidence will show the work is complete?

Handoff / Who checks it, and who receives the result?

02 / WRITE THE STEPS

How the work gets done

Use one box for each step. Match input and output names to page 1. Leave unused steps blank.

STEP 1 Name the action

Person or role

Skill needed

Inputs / What must be ready?

What happens?
Include checks and what to do if something fails.

Outputs / Name each result and its contents.

Required systems or workspaces

Helpful resources / Optional

STEP 2 Name the action

Person or role

Skill needed

Inputs / What must be ready?

What happens?
Include checks and what to do if something fails.

Outputs / Name each result and its contents.

Required systems or workspaces

Helpful resources / Optional

STEP 3 Name the action

Person or role

Skill needed

Inputs / What must be ready?

What happens?
Include checks and what to do if something fails.

Outputs / Name each result and its contents.

Required systems or workspaces

Helpful resources / Optional
